

PALM WAX FOR CONTAINERS

Natural palm wax, granular.

Allows to achieve very particular effects and fascinating crystallizations.

100% natural, does not require any additional additives besides colorants and fragrances.

Specific version for container casting, which allows perfect adhesion to the walls of the container.

INSTRUCTIONS

USE:

- The wax melts at 55 - 57°C, a temperature at which you can add the fragrances.
- If you want to add powdered pigments, bring the temperature to about 85/90°C (no higher), to ensure they dissolve properly.
- Do not exceed temperatures of 93°C: the wax may discolor after casting.
- If adding fragrances, we recommend not exceeding 10% by weight.
- Larger containers (more than 250 ml) require a lower casting temperature (about 50°C).
Metal containers or smaller than 250 ml require higher casting temperatures (about 70°C).
- Let the candles rest for 48 hours before lighting them.

IN COMBINATION WITH:

- Liquicer
- Powder pigments
- Wax pigment pastilles
- Any wick except Round Wick For Gel Wax and Flat Wick
